

2010

Science Fair

Student Logbook

Student Name: \_\_\_\_\_

Class: \_\_\_\_\_

Dear Parents and Students,

Here we go! You are about to embark on an adventure that will be filled with opportunity to learn and to explore the world of Science.

Preparing and displaying a Science Fair project is a wonderful way for children to express their creativity, learn how to plan, meet deadlines, and learn to set goals in order to meet each deadline. It is important to know that there will be no classroom time set aside to prepare for this project. All projects should be completed at home with parental assistance.

Each teacher will require the science project as part of the total grade for the 4<sup>th</sup> quarter. Requirements and weight of this grade will vary according to classroom. Any questions may be directed to your child's teacher.

All projects will be judged on Monday and Tuesday, May 24<sup>th</sup> and 25<sup>th</sup>, and they will be on display during our spring program the evening of the 25<sup>th</sup>.

Pastor Carol Morley,  
Administrator

# TIMELINE

Wednesday, February 24	Science Fair or Inventor's Fair letter sent home
Friday, March 5	Science Fair or Inventor's Fair commitment <b>DUE</b>
Monday, March 15	Science/Inventor Fair Logbooks sent home
Wednesday, March 24	Project Proposal <b>DUE</b>
Wednesday, April 7	Planning Page <b>DUE</b>
Wednesday, April 14	Research and Materials Pages <b>DUE</b>
Wednesday, April 21	Bibliography <b>DUE</b>
Wednesday, April 28	Procedures <b>DUE</b>
Wednesday, May 5	Graphs and Data <b>DUE</b>
Wednesday, May 12	Conclusion <b>DUE</b>
Wednesday, May 19	Abstract <b>DUE</b>
Monday, May 24	Projects and completed Logbooks <b>DUE</b>
Tuesday, May 25	Judging

# TOPIC IDEAS

A Bell System  
Types of Fuels  
Air Currents  
How Electricity is Made  
Electric Eye  
A Projector  
Functions of a Camera  
Glass and its Uses  
Molding  
Manufacturing Machinery  
Parts of an Electric Motor  
A String Pump in Action  
Our Solar System  
Phases of the Moon  
Salt and Its Uses  
Simple Machines  
Sound  
Fingerprinting  
Man's Natural Resources  
The Telephone  
Light  
Space Travel is Coming  
An Electromagnetic Crane  
Parts of a Sail Boat  
Parts of a Windmill  
Principles of a Transformer  
A Reed Basket  
Astronomy  
Chlorophyll  
Contour Mapping  
Minerals  
Rocks  
What Causes Erosion

History of Shells  
A Crystal Radio Set  
Fire Must Have Air to Burn  
Heat Can Produce Electricity  
An Electronic Map of Canada  
Weaving and Sewing Techniques  
Measuring the Ocean Depths  
How to Develop a Picture  
How Traffic Signals Work  
Operation of a Doorbell  
Minerals: Origin, Distribution  
Our Community Planning  
Printing and its Value to Man  
Cross Section of a Volcano  
Cross Section of an Oil Well  
Cross Section of the Earth  
Power and Food from the Sea  
Expansion and Contracting of Liquids  
Which Metals Conduct Heat  
Sending Messages by Electricity  
Water finds its Own Level  
Water Supports Heavy Weights  
Space Problems in Gravity  
The Fulcrum and the Lever  
Polar Constellations  
A Gasoline engine  
Working of a Telegraph  
Birth of a Balloon  
Causes of the Seasons  
Topographic Mapping  
Weather Instruments and Forecast  
Mining - Coal, Iron ore, etc,  
How Can Erosion be Prevented

A Chemical Change  
Action of a Solenoid  
A Door Chime  
Climate  
Electro Magnetism  
Fluorescent Lights  
Measuring Outer Space  
Model Airplanes  
Inside a Cave  
Mercury  
The Arc Light  
A Weather Station  
A Cotton Gin  
A Wheat Elevator  
Weather and Man  
Distillation of Water  
Sulfur  
The Telegraph Key  
Rotation of Planets  
Train Signal  
Snowflakes  
Machines and Tools  
Steam Propulsion  
Steam Turbines  
Products of Oil  
The Quartz Family  
Television  
The Blinker Light  
Canals and Locks  
Using a Compass  
Water Cycle  
Petroleum and Oil  
Water Pollution

# PLANNING PAGE

Developing a plan is an important step in solving a problem. Scientists use a problem solving plan known as the *Scientific Method*. In the plan you need to work through the following steps:

1. What do I want to find out? (state the problem)

---

---

---

2. What do I think will happen or how can I solve my problem? (Hypothesis: If this..., then that...)

---

---

---

3. How can I test my hypothesis? (Experiment)

---

---

---

4. What type of data can I collect? How will I collect and display the data?

---

---

---

5. What will I do with the data and results that I collect?

---

---

# RESEARCH

Gather information that relates to the topic area of your project by reading and referring to different resources.

## QUESTIONS TO GUIDE YOUR INVESTIGATION:

1. What field of science is related to your project? (human body, physical science, consumer science, plants, animals, earth science, etc.)

---

---

---

2. Do you know anyone who works in the field of science you are researching?

---

---

3. Where can you begin looking for information related to your project? (List some internet sites, books, videos.....)

---

---

---

---

---

---

---

---

---

---

# MATERIALS TO CONDUCT EXPERIMENTS

List the materials you might need to perform the experiments for your project. Even if you have some of the materials around your home, find the cost of the materials you would need. You might try finding the cost of materials in home supply stores, etc.

Material/ Item Needed	How many of each	Cost per item	Total for each item

Total cost of project: \_\_\_\_\_

Is it practical to perform the experiments as planned? Do I need to modify anything to make it more affordable?

# GRAPHS AND DATA

An experiment should give you information to compare. Repeating an experiment more than once helps to confirm your results and gives you even more information to compare. Graph or record your results in detail.

# CONCLUSION

Think about the scientific processes you used to work on your project. Answer the questions below to extend your thinking about your experience.

1. How has your final project changed from your original plan? Why?

---

---

---

---

---

---

2. Did the outcome of experiments prove your hypotheses? YES or NO

3. Identify and explain the types of data you used to prove or disprove your hypotheses?

---

---

---

---

---

---

4. What types of problems did you encounter throughout your scientific investigation as you worked on your project?

---

---

---

---

---

**5.If you developed this idea again, what would you do differently?**

---

---

---

---

---

---

---

---

**6.How is the information you learned through the scientific processes relevant to experiences in your real life?**

---

---

---

---

---

---

---

---

**7.What other ideas did you think of while working on this project?**

---

---

---

---

---

---

---

---

# ABSTRACT DIRECTIONS

The abstract is a brief summary of your project. Your abstract should answer the following questions:

1. What was the problem I was trying to solve or the purpose of my project?
2. What was my hypothesis?
3. What were my procedures?
4. What were my results?

The abstract must fit in the space provided on the next page and should be written in paragraph form. An example has been provided below.

## ABSTRACT EXAMPLE:

This would not actually appear on your written page. It is just here to help show you what to do,	Actual Abstract
Problem	I wanted to find out if plants will grow just as well in artificial light as they will in sunlight.
Hypothesis	Plants need light, water, and nutrients from the soil to grow. My hypothesis was that with plenty of water and nutrients, a plant should be able to grow almost as well in artificial light as in sunlight.
Procedure	I bought two young starter plants and a package of seeds. I prepared four small pots with the same soil and then planted the starter plants in two of the pots and seeds in the other two. I put one pot with a starter plant and one pot with seed outside in a sunny location. I put the other starter plant and seed pot inside near a bright light. I watered all four pots on the same schedule. I fertilized all four pots the same. I recorded new leaf growth and measured the height of all plants each week for four weeks.
Results	After four weeks, the results were pretty obvious. My potted plants that stayed inside all the time and out of real sunlight looked a lot different than the pots that sat outside in the sun. The starter plant that was outside was much fuller and had blossoms on it. The inside starter plant was not as nice and full and had no blossoms on it. The outside seed pot grew to be about as big as the starter plant used to be, but not the inside pot.

# DISPLAYING YOUR PROJECT

We recommend you purchase a display board that you can find at Walmart or Office Max locally. It is made of a sturdy cardboard and is divided into three sections so it will stand up for easy display. The layout does NOT have to be exactly like the diagram below. This is just an example of how your display might look.

<p><b><u>Procedure</u></b> (What you did)</p> <p>(Pictures and drawings)</p> <p><b><u>Credits</u></b> (List anybody who helped you)</p>	<p><b>Project Title</b> Student name and class</p> <p><b><u>Purpose</u></b> (What you wanted to find out)</p> <p><b><u>Hypothesis</u></b> (What you thought would happen)</p>	<p><b><u>Results</u></b> (What happened)</p> <p>(Charts and tables)</p> <p><b><u>Conclusion</u></b> (What you learned)</p>
---	---	--

In addition to the display board, you will need to bring in your completed Logbook and your experiments (Example: If your project involved growing molds, you should have items that you grew mold on to display.)

Remember, you will be graded and judged on

- Creativity and originality
- Neatness
- Accuracy
- Ability to present/explain your display to the judges
- Timeliness

## FIELD WORK AND NOTES

The following blank pages are here for you to use to record anything and everything that you might want or need for your project. If you do an experiment, you will record field measurements for each stage. Every time you write something down on these pages, you need to date it and make sure you are explaining what you did clearly. Often times, you will be able to use the information you wrote here to complete the reports and forms in the first part of this book. If, for some reason, you write notes down on loose pieces of paper (maybe you forgot to bring this book with you when you were working on your project), just date the loose pages and tape or paste them into your logbook.

You should keep note of any interviews or phone calls you make, phone numbers and email addresses, because you never know when you will need to email a contact again.
